

Weather App

A simple Flutter application to check the weather based on the city name using the OpenWeatherMap API.

Features

- Displays the current temperature and weather description of a specific city.
- Dynamically changes the background image based on the weather condition.
- Allows users to search for weather information by entering the city name.

##To run this application:

- install the app-release.apk in your android device.

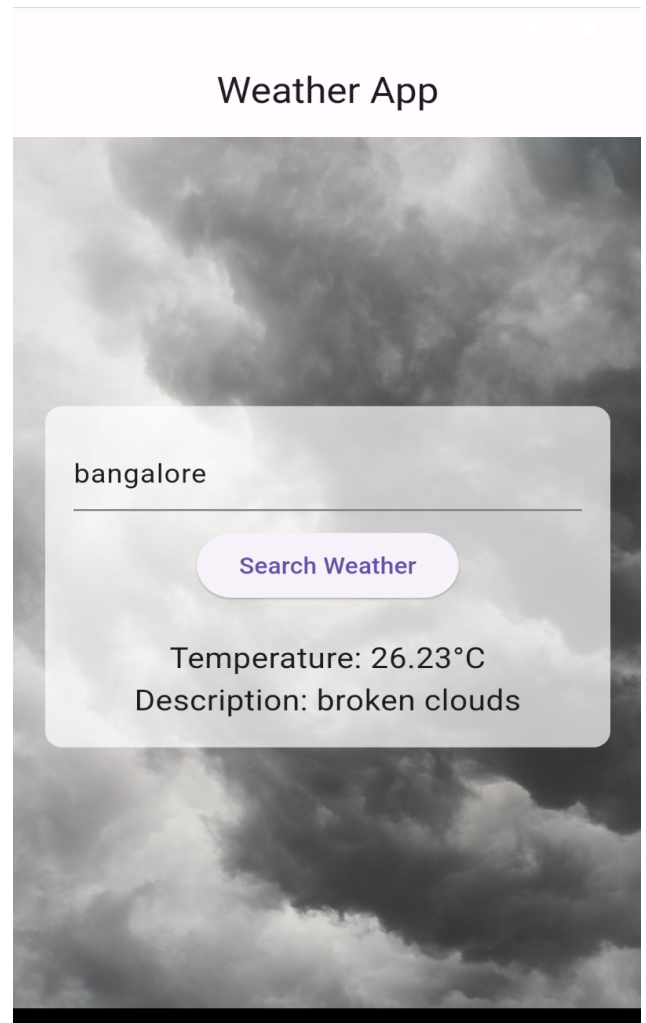

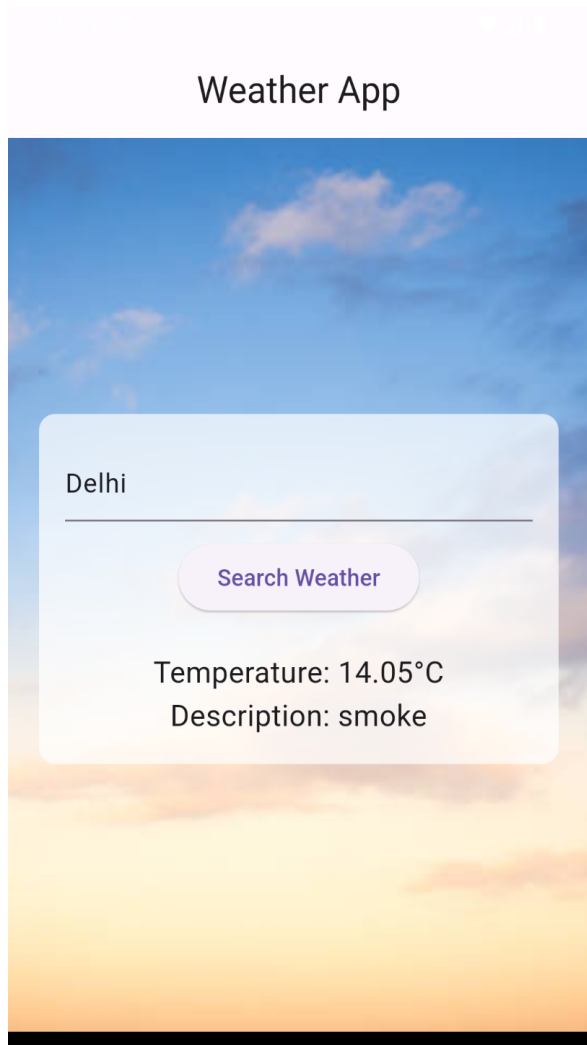

How this application works:

- Default position set for giving weather updates is London.
- write the name of the city in the search bar and click search.
- if written a wrong city it will show “city does not exist”
- screenshots added for help.
